- 1 Unmute your mic at any time and ask your doubt.

Hi, welcome to this

complex discussion.

Here are some “guidelines” for this TSC -

- 1 Unmute your mic at any time and ask your doubt.
- 2 I will not be checking chat often (or maybe at all), so posting it there might not be helpful.

Hi, welcome to this

complex discussion.

Here are some “guidelines” for this TSC -

- 1 Unmute your mic at any time and ask your doubt.
- 2 I will not be checking chat often (or maybe at all), so posting it there might not be helpful.

You can find a link to this document on bit.ly/ma-205. Both with and without pauses. You may keep it open alongside for quick reference.

Warning

This is primarily going to be a quick recap of the facts important.

Warning

This is primarily going to be a quick recap of the facts important. It is, of course, not possible to go through everything in just 2 hours.

Warning

This is primarily going to be a quick recap of the facts important. It is, of course, not possible to go through everything in just 2 hours.

In particular, this will *not* be a substitute for all the lectures done so far.

Warning

This is primarily going to be a quick recap of the facts important. It is, of course, not possible to go through everything in just 2 hours.

In particular, this will *not* be a substitute for all the lectures done so far.

I will also not be going through the proofs.

Warning

This is primarily going to be a quick recap of the facts important. It is, of course, not possible to go through everything in just 2 hours.

In particular, this will *not* be a substitute for all the lectures done so far.

I will also not be going through the proofs. We can discuss these finer things at the end, if time permits.

I will also not be going through the proofs. We can discuss these finer things at the end, if time permits.

Though I'm not a fan of this - this session is pretty much going to cover things important from the point of view of an exam.

Of course, I will not (intentionally) say anything which is mathematically incorrect.

Lecture 1

Definition 1 (Some notation)

Given $z_0 \in \mathbb{C}$ and $\delta > 0$, the δ -neighbourhood of z_0 , denoted by $B_\delta(z_0)$ is the set

$$B_\delta(z_0) := \{z \in \mathbb{C} : |z - z_0| < \delta\}.$$

Lecture 1

Definition 1 (Some notation)

Given $z_0 \in \mathbb{C}$ and $\delta > 0$, the δ -neighbourhood of z_0 , denoted by $B_\delta(z_0)$ is the set

$$B_\delta(z_0) := \{z \in \mathbb{C} : |z - z_0| < \delta\}.$$

Definition 2 (Open sets)

A set $U \subset \mathbb{C}$ is said to be open if:
for every $z_0 \in \mathbb{C}$, there exists *some* $\delta > 0$ such that

$$B_\delta(z_0) \subset U.$$

Lecture 1

Definition 1 (Some notation)

Given $z_0 \in \mathbb{C}$ and $\delta > 0$, the δ -neighbourhood of z_0 , denoted by $B_\delta(z_0)$ is the set

$$B_\delta(z_0) := \{z \in \mathbb{C} : |z - z_0| < \delta\}.$$

Definition 2 (Open sets)

A set $U \subset \mathbb{C}$ is said to be open if:
for every $z_0 \in \mathbb{C}$, there exists *some* $\delta > 0$ such that

$$B_\delta(z_0) \subset U.$$

Definition 3 (Path-connected sets)

A set $P \subset \mathbb{C}$ is said to be path-connected if any two points in P can be joined by a path in P . (A continuous function from $[0, 1]$ to P .)

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be open. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function.

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be **open**. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function.

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be **open**. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function. Let $z_0 \in \Omega$.

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be **open**. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function. Let $z_0 \in \Omega$. f is said to be *differentiable* at z_0 if

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be **open**. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function. Let $z_0 \in \Omega$. f is said to be *differentiable* at z_0 if

$$\lim_{z \rightarrow z_0} \frac{f(z) - f(z_0)}{z - z_0}$$

Definition 4 (Differentiable)

Let $\Omega \subset \mathbb{C}$ be **open**. Let

$$f : \Omega \rightarrow \mathbb{C}$$

be a function. Let $z_0 \in \Omega$. f is said to be *differentiable* at z_0 if

$$\lim_{z \rightarrow z_0} \frac{f(z) - f(z_0)}{z - z_0}$$

exists. In this case, it is denoted by $f'(z_0)$.

Definition 5 (Holomorphic)

A function f is said to be holomorphic on an open set Ω if it is differentiable at every $z_0 \in \Omega$.

A function f is said to be holomorphic at z_0 if it is holomorphic on some neighbourhood of z_0 .

Definition 5 (Holomorphic)

A function f is said to be holomorphic on an open set Ω if it is differentiable at every $z_0 \in \Omega$.

A function f is said to be holomorphic at z_0 if it is holomorphic on some neighbourhood of z_0 .

Remark 1

A function may be differentiable at z_0 but not holomorphic at z_0 .

Definition 5 (Holomorphic)

A function f is said to be holomorphic on an open set Ω if it is differentiable at every $z_0 \in \Omega$.

A function f is said to be holomorphic at z_0 if it is holomorphic on some neighbourhood of z_0 .

Remark 1

A function may be differentiable at z_0 but not holomorphic at z_0 . For example, $f(z) = |z|^2$ is differentiable only at 0.

Definition 5 (Holomorphic)

A function f is said to be holomorphic on an open set Ω if it is differentiable at every $z_0 \in \Omega$.

A function f is said to be holomorphic at z_0 if it is holomorphic on some neighbourhood of z_0 .

Remark 1

A function may be differentiable at z_0 but not holomorphic at z_0 . For example, $f(z) = |z|^2$ is differentiable only at 0. Thus, it is differentiable at 0 but holomorphic nowhere.

Definition 5 (Holomorphic)

A function f is said to be holomorphic on an open set Ω if it is differentiable at every $z_0 \in \Omega$.

A function f is said to be holomorphic at z_0 if it is holomorphic on some neighbourhood of z_0 .

Remark 1

A function may be differentiable at z_0 but not holomorphic at z_0 . For example, $f(z) = |z|^2$ is differentiable only at 0. Thus, it is differentiable at 0 but holomorphic nowhere.

For sets, however, there is no difference.

End of Lecture 1

Any questions?

From this point on, Ω will always denote an open subset of \mathbb{C} .
Whenever I write some complex number z as $z = x + iy$, it will be assumed that $x, y \in \mathbb{R}$.
Similarly for $f(z) = u(z) + iv(z)$.

Lecture 2: CR Equations

Let $f : \Omega \rightarrow \mathbb{C}$ be a function. We can decompose f as

$$f(z) = u(z) + \iota v(z),$$

where $u, v : \Omega \rightarrow \mathbb{R}$ are real valued functions.

Lecture 2: CR Equations

Let $f : \Omega \rightarrow \mathbb{C}$ be a function. We can decompose f as

$$f(z) = u(z) + \iota v(z),$$

where $u, v : \Omega \rightarrow \mathbb{R}$ are real valued functions.

The idea now is to consider u and v as functions of two variables. We can do so by simply considering $u(x, y) = u(x + \iota y)$ and similarly for v .

Lecture 2: CR Equations

Let $f : \Omega \rightarrow \mathbb{C}$ be a function. We can decompose f as

$$f(z) = u(z) + \iota v(z),$$

where $u, v : \Omega \rightarrow \mathbb{R}$ are real valued functions.

The idea now is to consider u and v as functions of two variables. We can do so by simply considering $u(x, y) = u(x + \iota y)$ and similarly for v . Now, if we know that f is holomorphic, then we have the following result.

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at a point $z_0 \in \Omega$. Let $z_0 = x_0 + iy_0$.

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at **a point** $z_0 \in \Omega$. Let

$z_0 = x_0 + iy_0$.

Then, we have

$$u_x(x_0, y_0) = v_y(x_0, y_0) \quad \text{and} \quad u_y(x_0, y_0) = -v_x(x_0, y_0).$$

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at a point $z_0 \in \Omega$. Let $z_0 = x_0 + \iota y_0$.

Then, we have

$$u_x(x_0, y_0) = v_y(x_0, y_0) \quad \text{and} \quad u_y(x_0, y_0) = -v_x(x_0, y_0).$$

Moreover, we have

$$f'(z_0) = u_x(x_0, y_0) + \iota v_x(x_0, y_0).$$

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at a point $z_0 \in \Omega$. Let

$$z_0 = x_0 + \iota y_0.$$

Then, we have

$$u_x(x_0, y_0) = v_y(x_0, y_0) \quad \text{and} \quad u_y(x_0, y_0) = -v_x(x_0, y_0).$$

Moreover, we have

$$f'(z_0) = u_x(x_0, y_0) + \iota v_x(x_0, y_0).$$

Note the subscript is x for both in the above.

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at a point $z_0 \in \Omega$. Let

$$z_0 = x_0 + \iota y_0.$$

Then, we have

$$u_x(x_0, y_0) = v_y(x_0, y_0) \quad \text{and} \quad u_y(x_0, y_0) = -v_x(x_0, y_0).$$

Moreover, we have

$$f'(z_0) = u_x(x_0, y_0) + \iota v_x(x_0, y_0).$$

Note the subscript is x for both in the above.

Also note that all the equalities are only at the point z_0 .

Lecture 2: CR Equations

Theorem 1 (CR equations)

Let $f : \Omega \rightarrow \mathbb{C}$ be differentiable at **a point** $z_0 \in \Omega$. Let

$$z_0 = x_0 + \iota y_0.$$

Then, we have

$$u_x(x_0, y_0) = v_y(x_0, y_0) \quad \text{and} \quad u_y(x_0, y_0) = -v_x(x_0, y_0).$$

Moreover, we have

$$f'(z_0) = u_x(x_0, y_0) + \iota v_x(x_0, y_0).$$

Note the subscript is x for both in the above.

Also note that all the equalities are only at **the point** z_0 . In particular, we are only assuming differentiability at z_0 .

Lecture 2: CR Equations

Converse? What is the converse?

Lecture 2: CR Equations

Converse? What is the converse? **No**. The converse is **not** true.

Lecture 2: CR Equations

Converse? What is the converse? **No**. The converse is **not** true.
An example for you to check is

$$f(z) := \begin{cases} \frac{\bar{z}^2}{z} & z \neq 0, \\ 0 & z = 0. \end{cases}$$

Lecture 2: CR Equations

Converse? What is the converse? **No**. The converse is **not** true.
An example for you to check is

$$f(z) := \begin{cases} \frac{\bar{z}^2}{z} & z \neq 0, \\ 0 & z = 0. \end{cases}$$

Check that u and v satisfy the CR equations at $(0,0)$ but f is not differentiable at $0 + 0i$. (Page 23 of slides.)

Lecture 2: CR Equations

We recall MA 105 now.

Definition 6 (Total derivative)

If $f : \Omega \rightarrow \mathbb{C}$ is a function, we may view it as a function

$$f : \Omega \rightarrow \mathbb{R}^2.$$

Recall that f is said to be real differentiable at $(x_0, y_0) \in \Omega \subset \mathbb{R}^2$ if

Lecture 2: CR Equations

We recall MA 105 now.

Definition 6 (Total derivative)

If $f : \Omega \rightarrow \mathbb{C}$ is a function, we may view it as a function

$$f : \Omega \rightarrow \mathbb{R}^2.$$

Recall that f is said to be real differentiable at $(x_0, y_0) \in \Omega \subset \mathbb{R}^2$ if there exists a 2×2 real matrix A such that

Lecture 2: CR Equations

We recall MA 105 now.

Definition 6 (Total derivative)

If $f : \Omega \rightarrow \mathbb{C}$ is a function, we may view it as a function

$$f : \Omega \rightarrow \mathbb{R}^2.$$

Recall that f is said to be real differentiable at $(x_0, y_0) \in \Omega \subset \mathbb{R}^2$ if there exists a 2×2 real matrix A such that

$$\lim_{(h,k) \rightarrow (0,0)} \frac{\left\| f(x_0 + h, y_0 + k) - f(x_0, y_0) - A \begin{bmatrix} h \\ k \end{bmatrix} \right\|}{\|(h, k)\|} = 0.$$

Lecture 2: CR Equations

We recall MA 105 now.

Definition 6 (Total derivative)

If $f : \Omega \rightarrow \mathbb{C}$ is a function, we may view it as a function

$$f : \Omega \rightarrow \mathbb{R}^2.$$

Recall that f is said to be real differentiable at $(x_0, y_0) \in \Omega \subset \mathbb{R}^2$ if there exists a 2×2 real matrix A such that

$$\lim_{(h,k) \rightarrow (0,0)} \frac{\left\| f(x_0 + h, y_0 + k) - f(x_0, y_0) - A \begin{bmatrix} h \\ k \end{bmatrix} \right\|}{\|(h, k)\|} = 0.$$

The matrix A was called the *total derivative of f at (x_0, y_0)* .

Lecture 2: CR Equations

Theorem 2

If f is (complex) differentiable at a point $z_0 = x_0 + iy_0$, then f is real differentiable at (x_0, y_0) .

Theorem 2

If f is (complex) differentiable at a point $z_0 = x_0 + iy_0$, then f is real differentiable at (x_0, y_0) .

Once again, this is only talking about differentiability at a point.

Theorem 2

If f is (complex) differentiable at a point $z_0 = x_0 + iy_0$, then f is real differentiable at (x_0, y_0) .

Once again, this is only talking about differentiability at a point. The converse is again **not** true.

Lecture 2: CR Equations

Theorem 2

If f is (complex) differentiable at a point $z_0 = x_0 + iy_0$, then f is real differentiable at (x_0, y_0) .

Once again, this is only talking about differentiability at a point. The converse is again **not** true.

Thus, we have seen two sufficient conditions for complex differentiability so far. Neither is individually sufficient.

Lecture 2: CR Equations

Theorem 2

If f is (complex) differentiable at a point $z_0 = x_0 + iy_0$, then f is real differentiable at (x_0, y_0) .

Once again, this is only talking about differentiability at a point. The converse is again **not** true.

Thus, we have seen two sufficient conditions for complex differentiability so far. Neither is individually sufficient. However, together, they are.

Theorem 3

Let $f : \Omega \rightarrow \mathbb{C}$ be a function and let $z_0 \in \mathbb{C}$. If

Theorem 3

Let $f : \Omega \rightarrow \mathbb{C}$ be a function and let $z_0 \in \mathbb{C}$. If the CR equations hold **at the point** (x_0, y_0) and

Theorem 3

Let $f : \Omega \rightarrow \mathbb{C}$ be a function and let $z_0 \in \mathbb{C}$. If the CR equations hold **at the point** (x_0, y_0) and if f is real differentiable **at the point** (x_0, y_0) , then

Theorem 3

Let $f : \Omega \rightarrow \mathbb{C}$ be a function and let $z_0 \in \mathbb{C}$. If the CR equations hold **at the point** (x_0, y_0) and if f is real differentiable **at the point** (x_0, y_0) , then f is complex differentiable **at the point** z_0 .

Lecture 2: CR Equations

Definition 7 (Harmonic functions)

Let $u : \Omega \rightarrow \mathbb{R}$ be a twice continuously differentiable function. u is said to be *harmonic* if $u_{xx} + u_{yy} = 0$.

Lecture 2: CR Equations

Definition 7 (Harmonic functions)

Let $u : \Omega \rightarrow \mathbb{R}$ be a twice continuously differentiable function. u is said to be *harmonic* if $u_{xx} + u_{yy} = 0$.

Proposition 1

The real and imaginary parts of a holomorphic function are harmonic.

Lecture 2: CR Equations

Definition 7 (Harmonic functions)

Let $u : \Omega \rightarrow \mathbb{R}$ be a twice continuously differentiable function. u is said to be *harmonic* if $u_{xx} + u_{yy} = 0$.

Proposition 1

The real and imaginary parts of a holomorphic function are harmonic.

Suppose u and v are harmonic on Ω . v is said to be a harmonic conjugate of u if $f = u + iv$ is holomorphic on Ω .

Lecture 2: CR Equations

Definition 7 (Harmonic functions)

Let $u : \Omega \rightarrow \mathbb{R}$ be a twice continuously differentiable function. u is said to be *harmonic* if $u_{xx} + u_{yy} = 0$.

Proposition 1

The real and imaginary parts of a holomorphic function are harmonic.

Suppose u and v are harmonic on Ω . v is said to be a harmonic conjugate of u if $f = u + iv$ is holomorphic on Ω .

If v is a harmonic conjugate of u , then $-u$ is a harmonic conjugate of v .

Lecture 2: CR Equations

Definition 7 (Harmonic functions)

Let $u : \Omega \rightarrow \mathbb{R}$ be a twice continuously differentiable function. u is said to be *harmonic* if $u_{xx} + u_{yy} = 0$.

Proposition 1

The real and imaginary parts of a holomorphic function are harmonic.

Suppose u and v are harmonic on Ω . v is said to be a harmonic conjugate of u if $f = u + iv$ is holomorphic on Ω .

If v is a harmonic conjugate of u , then $-u$ is a harmonic conjugate of v .

Check the second last slide of this lecture to find the algorithm for finding a harmonic conjugate.

End of Lecture 2

Any questions?

Lecture 3: Power Series

Definition 8 (Convergence of series)

A series of the form

$$\sum_{n=0}^{\infty} a_n$$

of complex numbers is said to converge if the sequence of partial sums

$$s_n = \sum_{k=0}^n a_k$$

converges (to a finite complex number).

Lecture 3: Power Series

Definition 8 (Convergence of series)

A series of the form

$$\sum_{n=0}^{\infty} a_n$$

of complex numbers is said to converge if the sequence of partial sums

$$s_n = \sum_{k=0}^n a_k$$

converges (to a finite complex number).

The sequence of partial sums is just the following sequence:

$$a_0, a_0 + a_1, a_0 + a_1 + a_2, \dots$$

Lecture 3: Power Series

Definition 8 (Convergence of series)

A series of the form

$$\sum_{n=0}^{\infty} a_n$$

of complex numbers is said to converge if the sequence of partial sums

$$s_n = \sum_{k=0}^n a_k$$

converges (to a finite complex number).

The sequence of partial sums is just the following sequence:

$$a_0, a_0 + a_1, a_0 + a_1 + a_2, \dots$$

“Divergent” is simply used to mean “not convergent.”

Lecture 3: Power Series

Definition 8 (Convergence of series)

A series of the form

$$\sum_{n=0}^{\infty} a_n$$

of complex numbers is said to converge if the sequence of partial sums

$$s_n = \sum_{k=0}^n a_k$$

converges (to a finite complex number).

The sequence of partial sums is just the following sequence:

$$a_0, a_0 + a_1, a_0 + a_1 + a_2, \dots$$

“Divergent” is simply used to mean “not convergent.”

Check that $\sum (-1)^n$ and $\sum n$ both diverge.

Definition 9 (limsup)

Given a sequence (x_n) of **real numbers**, we may define a new sequence (y_n) as

Definition 9 (limsup)

Given a sequence (x_n) of **real numbers**, we may define a new sequence (y_n) as

$$y_n = \sup\{x_m : m \geq n\}.$$

Lecture 3: Power Series

Definition 9 (limsup)

Given a sequence (x_n) of **real numbers**, we may define a new sequence (y_n) as

$$y_n = \sup\{x_m : m \geq n\}.$$

The limit of this sequence always exists and we define

$$\limsup_{n \rightarrow \infty} x_n = \lim_{n \rightarrow \infty} y_n.$$

Lecture 3: Power Series

Definition 9 (limsup)

Given a sequence (x_n) of **real numbers**, we may define a new sequence (y_n) as

$$y_n = \sup\{x_m : m \geq n\}.$$

The limit of this sequence always exists and we define

$$\limsup_{n \rightarrow \infty} x_n = \lim_{n \rightarrow \infty} y_n.$$

Remark 2

Each y_n might be ∞ . That is allowed.

Lecture 3: Power Series

Definition 9 (limsup)

Given a sequence (x_n) of **real numbers**, we may define a new sequence (y_n) as

$$y_n = \sup\{x_m : m \geq n\}.$$

The limit of this sequence always exists and we define

$$\limsup_{n \rightarrow \infty} x_n = \lim_{n \rightarrow \infty} y_n.$$

Remark 2

Each y_n might be ∞ . That is allowed.

The limsup might be ∞ . This is also allowed.

Lecture 3: Power Series

We will be interested in discussing radius of convergence of *power series*. We all know what that is. It is a series of the form

$$\sum_{n=0}^{\infty} a_n (z - z_0)^n \quad (*)$$

where $z_0 \in \mathbb{C}$ and each $a_n \in \mathbb{C}$.

Lecture 3: Power Series

We will be interested in discussing radius of convergence of *power series*. We all know what that is. It is a series of the form

$$\sum_{n=0}^{\infty} a_n (z - z_0)^n \quad (*)$$

where $z_0 \in \mathbb{C}$ and each $a_n \in \mathbb{C}$.

What is the radius of convergence, though?

Lecture 3: Power Series

We will be interested in discussing radius of convergence of *power series*. We all know what that is. It is a series of the form

$$\sum_{n=0}^{\infty} a_n (z - z_0)^n \quad (*)$$

where $z_0 \in \mathbb{C}$ and each $a_n \in \mathbb{C}$.

What is the radius of convergence, though? (The definition, that is.)

Theorem 4 (Radius of convergence)

Given any power series as $(*)$, there exists $R \in [0, \infty]$ such that

- 1 $(*)$ converges for any z with $|z - z_0| < R$

This R is called the radius of convergence.

Lecture 3: Power Series

We will be interested in discussing radius of convergence of *power series*. We all know what that is. It is a series of the form

$$\sum_{n=0}^{\infty} a_n(z - z_0)^n \quad (*)$$

where $z_0 \in \mathbb{C}$ and each $a_n \in \mathbb{C}$.

What is the radius of convergence, though? (The definition, that is.)

Theorem 4 (Radius of convergence)

Given any power series as $(*)$, there exists $R \in [0, \infty]$ such that

- 1 $(*)$ converges for any z with $|z - z_0| < R$, and
- 2 $(*)$ diverges for any z with $|z - z_0| > R$.

This R is called the radius of convergence.

Lecture 3: Power Series

We will be interested in discussing radius of convergence of *power series*. We all know what that is. It is a series of the form

$$\sum_{n=0}^{\infty} a_n(z - z_0)^n \quad (*)$$

where $z_0 \in \mathbb{C}$ and each $a_n \in \mathbb{C}$.

What is the radius of convergence, though? (The definition, that is.)

Theorem 4 (Radius of convergence)

Given any power series as $(*)$, there exists $R \in [0, \infty]$ such that

- ① $(*)$ converges for any z with $|z - z_0| < R$, and
- ② $(*)$ diverges for any z with $|z - z_0| > R$.

This R is called the radius of convergence.

Note the **brackets**.

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Let $(*)$ be as earlier. Define

$$\alpha = \limsup_{n \rightarrow \infty} \sqrt[n]{a_n}.$$

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Let $(*)$ be as earlier. Define

$$\alpha = \limsup_{n \rightarrow \infty} \sqrt[n]{a_n}.$$

Then, $R = \alpha^{-1}$ is the radius of convergence.

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Let $(*)$ be as earlier. Define

$$\alpha = \limsup_{n \rightarrow \infty} \sqrt[n]{a_n}.$$

Then, $R = \alpha^{-1}$ is the radius of convergence.

This test *always works*. We had no assumptions of any kind on $(*)$.

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Let $(*)$ be as earlier. Define

$$\alpha = \limsup_{n \rightarrow \infty} \sqrt[n]{a_n}.$$

Then, $R = \alpha^{-1}$ is the radius of convergence.

This test *always works*. We had no assumptions of any kind on $(*)$. Note that $^{-1}$.

Lecture 3: Power Series

We would now like to be able to calculate the radius of convergence.

Theorem 5 (Root test)

Let $(*)$ be as earlier. Define

$$\alpha = \limsup_{n \rightarrow \infty} \sqrt[n]{a_n}.$$

Then, $R = \alpha^{-1}$ is the radius of convergence.

This test *always works*. We had no assumptions of any kind on $(*)$. Note that $^{-1}$.

If $\alpha = 0$, then $R = \infty$ and vice-versa.

Lecture 3: Power Series

We have another test. This is simpler (to calculate) but mightn't always work.

Theorem 6 (Ratio test)

Let $(*)$ be as earlier.

Lecture 3: Power Series

We have another test. This is simpler (to calculate) but mightn't always work.

Theorem 6 (Ratio test)

Let $(*)$ be as earlier.

Assume that the limit

$$R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

exists.

Lecture 3: Power Series

We have another test. This is simpler (to calculate) but mightn't always work.

Theorem 6 (Ratio test)

Let $(*)$ be as earlier.

Assume that the limit

$$R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

exists.

Then, R is the radius of convergence.

Lecture 3: Power Series

We have another test. This is simpler (to calculate) but mightn't always work.

Theorem 6 (Ratio test)

Let $(*)$ be as earlier.

Assume that the limit

$$R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

exists.

Then, R is the radius of convergence.

Note that here we assume that the limit does exist. This may not always be true.

Lecture 3: Power Series

We have another test. This is simpler (to calculate) but mightn't always work.

Theorem 6 (Ratio test)

Let $(*)$ be as earlier.

Assume that the limit

$$R = \lim_{n \rightarrow \infty} \left| \frac{a_n}{a_{n+1}} \right|$$

exists.

Then, R is the radius of convergence.

Note that here we assume that the limit does exist. This may not always be true.

Note that I'm not taking any inverse here but also note the way the ratio is taken. We have a_n/a_{n+1} .

Lecture 3: Power Series

Differentiability of power series is what one should expect.

Theorem 7 (Differentiability)

Let $\sum_{n=0}^{\infty} a_n z^n$ be a power series with radius of convergence $R > 0$. On the **open disc** of radius R , let $f(z)$ denote this sum. Then, on this disc, we have

$$f'(z) =$$

Lecture 3: Power Series

Differentiability of power series is what one should expect.

Theorem 7 (Differentiability)

Let $\sum_{n=0}^{\infty} a_n z^n$ be a power series with radius of convergence $R > 0$. On the **open disc** of radius R , let $f(z)$ denote this sum. Then, on this disc, we have

$$f'(z) = \sum_{n=1}^{\infty} n a_n z^{n-1}.$$

Lecture 3: Power Series

Differentiability of power series is what one should expect.

Theorem 7 (Differentiability)

Let $\sum_{n=0}^{\infty} a_n z^n$ be a power series with radius of convergence $R > 0$. On the **open disc** of radius R , let $f(z)$ denote this sum. Then, on this disc, we have

$$f'(z) = \sum_{n=1}^{\infty} n a_n z^{n-1}.$$

Note that this is again a power series with the same radius of convergence. Thus, we may repeat the process indefinitely.

Lecture 3: Power Series

Differentiability of power series is what one should expect.

Theorem 7 (Differentiability)

Let $\sum_{n=0}^{\infty} a_n z^n$ be a power series with radius of convergence $R > 0$. On the **open disc** of radius R , let $f(z)$ denote this sum. Then, on this disc, we have

$$f'(z) = \sum_{n=1}^{\infty} n a_n z^{n-1}.$$

Note that this is again a power series with the same radius of convergence. Thus, we may repeat the process indefinitely. In other words, power series are infinite differentiable.

Remark 4

The above classification is only for **isolated** singularities.

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

Theorem 23 (Riemann's Removable Singularity Theorem)

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

These are characterised by the following theorem.

Theorem 23 (Riemann's Removable Singularity Theorem)

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

These are characterised by the following theorem.

Theorem 23 (Riemann's Removable Singularity Theorem)

z_0 is a removable singularity of f iff

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

These are characterised by the following theorem.

Theorem 23 (Riemann's Removable Singularity Theorem)

z_0 is a removable singularity of f iff $\lim_{z \rightarrow z_0} f(z)$ exists.

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

These are characterised by the following theorem.

Theorem 23 (Riemann's Removable Singularity Theorem)

z_0 is a removable singularity of f iff $\lim_{z \rightarrow z_0} f(z)$ exists.

In the above, we mean that it exists as a (finite) complex number.

Lecture 8: Singularities

Definition 18 (Removable singularity)

If an isolated singularity can be removed by defining the function by assigning a certain value at that point, we say that the singularity is removable.

These are characterised by the following theorem.

Theorem 23 (Riemann's Removable Singularity Theorem)

z_0 is a removable singularity of f iff $\lim_{z \rightarrow z_0} f(z)$ exists.

In the above, we mean that it exists as a (finite) complex number.

$$f(z) = \frac{\sin z}{z}$$

defined on $\mathbb{C} \setminus \{0\}$ has 0 as a removable singularity.

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Theorem 24

An isolated singularity z_0 is a pole of f iff $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$.

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Theorem 24

An isolated singularity z_0 is a pole of f iff $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$.

Theorem 25 (Order of a pole)

If z_0 is a pole of f , then there exists an integer $m > 0$ such that

$$f(z) = (z - z_0)^{-m} f_1(z)$$

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Theorem 24

An isolated singularity z_0 is a pole of f iff $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$.

Theorem 25 (Order of a pole)

If z_0 is a pole of f , then there exists an integer $m > 0$ such that

$$f(z) = (z - z_0)^{-m} f_1(z)$$

on a punctured neighbourhood of z_0 , for some function f_1 which is holomorphic on the complete neighbourhood.

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Theorem 24

An isolated singularity z_0 is a pole of f iff $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$.

Theorem 25 (Order of a pole)

If z_0 is a pole of f , then there exists an integer $m > 0$ such that

$$f(z) = (z - z_0)^{-m} f_1(z)$$

on a punctured neighbourhood of z_0 , for some function f_1 which is holomorphic on the complete neighbourhood. The **smallest** such integer m is called the *order* of the pole.

Lecture 8: Singularities

Definition 19 (Pole)

An isolated singularity z_0 is said to be a pole if $|f(z)| \rightarrow \infty$ as $z \rightarrow z_0$.

Theorem 24

An isolated singularity z_0 is a pole of f iff $\lim_{z \rightarrow z_0} \frac{1}{f(z)} = 0$.

Theorem 25 (Order of a pole)

If z_0 is a pole of f , then there exists an integer $m > 0$ such that

$$f(z) = (z - z_0)^{-m} f_1(z)$$

on a punctured neighbourhood of z_0 , for some function f_1 which is holomorphic on the complete neighbourhood. The **smallest** such integer m is called the *order* of the pole.

If the order is 1, then z_0 is said to be *simple* pole.

Lecture 8: Singularities

Definition 20 (Essential singularity)

An isolated singularity is called an essential singularity if it is neither a removable singularity nor a pole.

Theorem 26 (Casorati-Weierstrass Theorem)

Lecture 8: Singularities

Definition 20 (Essential singularity)

An isolated singularity is called an essential singularity if it is neither a removable singularity nor a pole.

Theorem 26 (Casorati-Weierstrass Theorem)

If z_0 is an isolated singularity, then it is essential iff

Lecture 8: Singularities

Definition 20 (Essential singularity)

An isolated singularity is called an essential singularity if it is neither a removable singularity nor a pole.

Theorem 26 (Casorati-Weierstrass Theorem)

If z_0 is an isolated singularity, then it is essential iff the values of f come arbitrarily close to every complex number in a neighborhood of z_0 .

End of Lecture 8

Any questions?

Theorem 27 (Modified CIF)

Lecture 9: Laurent Series

Theorem 28 (Laurent Series)

With the same setup as earlier, for $z \in A$, we can write $f(z)$ as

$$f(z) = \sum_{n=-\infty}^{\infty} a_n(z - z_0)^n,$$

where each a_n is given, as before, by

$$a_n = \frac{1}{2\pi i} \int_{|z-w|=r_0} \frac{f(w)}{(z-w)^{n+1}} dw,$$

where $r < r_0 < R$.

Note that the above is valid for $n < 0$ as well.

Lecture 9: Laurent Series

The most interesting coefficient is the -1^{st} one.

Lecture 9: Laurent Series

The most interesting coefficient is the -1^{st} one. When we integrate a Laurent series along a circle centered at z_0 , only a_{-1} remains (with a factor of $2\pi i$).

Lecture 9: Laurent Series

The most interesting coefficient is the -1^{st} one. When we integrate a Laurent series along a circle centered at z_0 , only a_{-1} remains (with a factor of $2\pi i$). This is given by

$$a_{-1} = \frac{1}{2\pi i} \int_{|z-z_0|=r_0} f(w)dw.$$

Lecture 9: Laurent Series

The most interesting coefficient is the -1^{st} one. When we integrate a Laurent series along a circle centered at z_0 , only a_{-1} remains (with a factor of $2\pi i$). This is given by

$$a_{-1} = \frac{1}{2\pi i} \int_{|z-z_0|=r_0} f(w)dw.$$

This is what is usually called the *residue* and written as

Lecture 9: Laurent Series

The most interesting coefficient is the -1^{st} one. When we integrate a Laurent series along a circle centered at z_0 , only a_{-1} remains (with a factor of $2\pi i$). This is given by

$$a_{-1} = \frac{1}{2\pi i} \int_{|z-z_0|=r_0} f(w)dw.$$

This is what is usually called the *residue* and written as

$$a_{-1} = \text{Res}(f; z_0).$$

With residues, calculation of integrals becomes easier.

Theorem 29 (Cauchy's Residue Theorem)

Suppose f is given and has finitely many singularities z_1, \dots, z_n within a **simple** closed contour γ .

Lecture 9: Laurent Series

With residues, calculation of integrals becomes easier.

Theorem 29 (Cauchy's Residue Theorem)

Suppose f is given and has finitely many singularities z_1, \dots, z_n within a **simple** closed contour γ . Then, we have

$$\int_{\gamma} f(z) dz = 2\pi i \sum_{i=1}^n \text{Res}(f; z_i).$$

Lecture 9: Laurent Series

With residues, calculation of integrals becomes easier.

Theorem 29 (Cauchy's Residue Theorem)

Suppose f is given and has finitely many singularities z_1, \dots, z_n within a **simple** closed contour γ . Then, we have

$$\int_{\gamma} f(z) dz = 2\pi i \sum_{i=1}^n \text{Res}(f; z_i).$$

Note that the above is implicitly implying that f is holomorphic at all other points within γ .

Lecture 9: Laurent Series

Definition 21 (Principal part of a Laurent Series)

Given a Laurent series as earlier, its principal part is

Theorem 30 (Isolated singularities and their principal parts)

Lecture 9: Laurent Series

Definition 21 (Principal part of a Laurent Series)

Given a Laurent series as earlier, its principal part is

$$\sum_{n=-\infty}^{-1} a_n(z - z_0)^n.$$

- ③ essential iff the principal part has infinitely many terms.

Lecture 9: Laurent Series

Definition 21 (Principal part of a Laurent Series)

Given a Laurent series as earlier, its principal part is

$$\sum_{n=-\infty}^{-1} a_n(z - z_0)^n.$$

Theorem 30 (Isolated singularities and their principal parts)

The isolated singularity z_0 is

- ① removable iff the principal part has no terms,
- ② a pole iff the principal part has finitely many (and at least one) terms, and
- ③ essential iff the principal part has infinitely many terms.

In particular, the residue at a removable singularity is 0.

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

By the previous theorem, we know that f can be written as

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

By the previous theorem, we know that f can be written as

$$f(z) = \frac{a_{-m}}{(z - z_0)^m} + \cdots + \frac{a_{-1}}{z - z_0} + a_0 + a_1(z - z_0) + \cdots ,$$

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

By the previous theorem, we know that f can be written as

$$f(z) = \frac{a_{-m}}{(z - z_0)^m} + \cdots + \frac{a_{-1}}{z - z_0} + a_0 + a_1(z - z_0) + \cdots ,$$

for some integer $m > 0$.

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

By the previous theorem, we know that f can be written as

$$f(z) = \frac{a_{-m}}{(z - z_0)^m} + \cdots + \frac{a_{-1}}{z - z_0} + a_0 + a_1(z - z_0) + \cdots,$$

for some integer $m > 0$.

Thus,

$$g(z) = (z - z_0)^m f(z)$$

is holomorphic at z_0 and

Lecture 9: Laurent Series

Now, we see how one can calculate residue at a pole.

By the previous theorem, we know that f can be written as

$$f(z) = \frac{a_{-m}}{(z - z_0)^m} + \cdots + \frac{a_{-1}}{z - z_0} + a_0 + a_1(z - z_0) + \cdots,$$

for some integer $m > 0$.

Thus,

$$g(z) = (z - z_0)^m f(z)$$

is holomorphic at z_0 and

$$a_{-1} = \frac{1}{(m-1)!} g^{(m-1)}(z_0).$$

The End
